## Demo Kits

The Akasel Demo Kits are a unique way of testing the latest consumables in metallographic sample preparation.

We have created 21 different Demo Kits for the preparation of either specific materials or material groups.

A Demo Kit contains all necessary consumables and user guides for grinding and polishing and will allow you to prepare at least 50 samples.

The included grinding discs Aka-Piatto, Aka-Allegran or Aka-Largan have a long lifetime and can replace at least 100 - 200 pieces of grinding paper.

It also contains the Aka-Brief, a detailed overview of the preparation method with pictures of the sample after each preparation step, and comprehensive tips and tricks.

Additionally, a dressing stick for dressing the included grinding discs, and a diamond stick for priming the polishing cloth are included.

With a Demo Kit you will be able to test the Akasel way of sample preparation at your convenience.

## Cutting

### Cut-off Wheels

Metallographic cutting is the first and very important step in sample preparation.

To take out a representative sample from a large workpiece or to make longitudinal or cross sections of smaller parts, it must be ensured that the sample is removed without the creation of heat that could modify or even damage the structure.

The surface of the sample after cutting must be free from thermal damage and with a minimum of mechanical deformation. Otherwise the following preparation steps will take a very long time, and there is a risk that possible changes to the microstructure are not removed and may be seen as the 'real' structure.

Our wheels are, in respect of the above, optimised especially for metallographic cutting to provide perfect results in the shortest possible time.

The abrasive cut-off wheels for laboratory and production type cut-off machines are available in 4 different standard sizes, from 250 to 400 mm dia., with an arbor size of 32 mm dia.

Our precision cut-off wheels are optimised for high precision cutting of different materials. They are as thin as possible in relation to the diameter to remove an absolute minimum of material, a critical factor when sectioning expensive materials. Thin cut-off wheels limit the thermal damage and mechanical deformation during cutting. This again reduces the following grinding and polishing time.

Our range of premium cut-off wheels is named with both the material group they are designed for and the approximate hardness range. As can be seen in the table on the following Side, there are two Fe wheels for ferrous metals with a hardness of approximately 60 and 50 HRC.

The third wheel is especially developed for titanium and titanium alloys, and the fourth wheel is designed for other, soft non-ferrous metals.

Aka-Cut 350 HV, Aka-Cut 500 HV and Aka-Cut 650 HV are fibre-reinforced wheels, well suited for cutting surface hardened workpieces with a hardness from 200-700 HV. The fibre-reinforcement strengthens the wheel and reduces breaking when subjected to pinching.

Use the table below to select the correct wheel for your specific material type, hardness and size.

For materials, like ceramics, very hard ferrous metals and plastics, we have diamond cut-off wheels and a CBN cut-off wheel, that provide optimal sectioning for these materials. These superabrasive precision cut-off wheels are available in 152 mm and 250 mm dia.

Aka-Cut 50 HV is an electroplated diamond cut-off wheel designed for cutting soft materials like resin or plastic, such as electronic components.

Aka-Cut 1500 HV is a resin bond CBN cut-off wheel specifically formulated for cutting very hard ferrous metals with a hardness between 700 and 1500 HV.

Aka-Cut 2000 HV is a metal bond diamond cut-off wheel ideally suited for cutting medium-hard and brittle ceramics, concrete, rocks, tiles, and similar materials with a hardness above 700 HV.

Aka-Cut 3000 HV is a resin bond diamond cut-off wheel recommended for cutting extremely hard ceramics like oxides, carbides, nitrides, and borides, as well as materials containing large amounts of ceramic in a metal matrix, such as sintered carbides and powder metallurgy, with a hardness exceeding 1500 HV.

Additionally, we also have a selection of precision cut-off wheels in 150 mm dia. for cutting ferrous and non-ferrous metals with a hardness between 50 HV and 1000 HV.

## Additives for Recirculation Units

Aka-Cut cut-off wheels will perform at their very best together with Aka-Cool, an additive for recirculation units. Aka-Cool improves the cooling and lubricating ability of the water and acts as corrosion protection for both cut-off machine and sample material.

Aka-Cool is free from amine and boric acid, common in many other machine coolants. The absence of amines gives optimum skin compatibility with a pH of the mixed cooling fluid between 7 – 8, and an extremely low allergy potential.

The recommended mixing ratio of Aka-Cool in water is 3 – 5 %.

Aka-Cool guarantees a long service life of the coolant and a safe and economical process flow.

Both in regards of cost and personal safety Aka-Cool is the optimal choice.

When excessive foaming of the cooling water occurs, Aka-NoFoam is the solution. Any formation of foam drastically reduces cooling of the sample during cutting and can result in thermal damage.

Aka-NoFoam eliminates foam and thus increases the cooling ability of the cooling water.

The recommended mixing ratio of Aka-NoFoam in the cooling fluid is 0.5 – 1 %.

## Mounting

Mounting serves several different purposes:

- Protection/support of the sample surface
- Easier handling
- Having several small samples in one mount
- Having uniform sizes for clamping in sample holders

There are two different mounting methods; cold and hot mounting. Several resins are available that each have different strengths and advantages.

## Cold Mounting

Cold mounting resins typically consist of two components that cure after being mixed together. Two different systems are available; epoxies and acrylics.

The epoxies consist of a liquid resin and a liquid hardener.

Our epoxy resin can be mixed with either the Aka-Cure Slow or Aka-Cure Quick hardener, depending on the requirements. Both have very good adhesion to the sample, which helps to provide the best possible edge retention. They can also be used for vacuum impregnation of fragile and porous samples like ceramics and plasma spray coatings. Aka-Cure Slow cures in 8-24 hours at 22°C (room temperature). Aka-Cure Quick cures in 30 minutes when heated to 80°C.

We offer epoxy resin and hardeners separate, not as a kit, to make it easy to use either hardener with the resin.

Epoxies require precision when mixing the two components. It can be measured by volume, but weighing is much more precise and the recommended method.

Our acrylic resin consists of a powder and a liquid.

Aka-Clear-2 is a fast curing, transparent system with a slightly yellowish tint. It cures in 8-10 minutes and produces totally clear, bubble-free mounts without having to use a pressure pot.

Mixing of the 2 components is not critical, if a thinner mix is required, a little extra liquid can be added without adverse effect on the cured mounts.

*With Aka-Clear-2 Powder, 1 kg we ship 2 measuring spoons, 2 reusable mixing cups and 25 wooden mixing sticks for easy measuring and mixing of the resin. With the Aka-Resin Epoxy, 1 l we ship the same, except the measuring spoons, as the epoxy resin and hardener should be measured by weight and not by volume.*

Cold Mounting			
Type	Epoxy		Acrylic
Component 1	Aka-Resin Liquid Epoxy Viscosity: 600-700 cps @25°C		Aka-Clear-2 Powder
Component 2	Aka-Cure Slow Viscosity: 20 cps @25°C	Aka-Cure Quick Viscosity: 80 cps @25°C	Aka-Clear-2 Liquid
Mixing ratio by weight	100 g of resin:12 g of Aka-Cure Slow	100 g of resin:26.3 g of Aka-Cure Quick	10 g of powder:6.3 g of liquid
Mixing ratio by volume	100 parts of resin:13.5 parts of Aka-Cure Slow	100 parts of resin:30 parts of Aka-Cure Quick	2 parts of powder:1 part of liquid
Curing time	8-24 hours @ 22°C Long pot life and low peak temperature, suitable for both vacuum impregnation and mounting of heat sensitive samples. Not suitable for large mounts due to excessive exothermal reaction	30 min. when heated to 80°C. Peak temperature up to 200°C. For very hard, transparent mounts. Very large mounts can be made using a 2 cycle curing schedule. First, the mount is cured without heating in 8 hours, followed by a 1 h cycle @ 100°C	8-10 minutes @ 22°C. Peak temperature up to 90°C
Shrinkage, 1-5, 1 = best/lowest	1	2	3
Recommended applications	Transparent, very low curing temperature, no shrinkage, for sensitive materials. Vacuum impregnation	Transparent, very fast epoxy system, for vacuum impregnation of porous samples	Completely clear for easy visibility of sample, mounting of electronic components, failure analysis

## Hot Mounting

Hot mounting resins are single compounds for use in mounting presses. With hot mounting you can produce uniform samples in a short time, and each resin has different characteristics, strengths and advantages. Below you find a description of our hot mounting resins, their different characteristics, insights and application recommendations.

Resin	Mount	Shrinkage/edge retention rating 1-5*	Approx. no. of mounts with 7.5 kg of resin**	Type and recommended applications
Aka-Resin Epoxy		1	410	Epoxy with hard mineral filler, best edge retention for hard materials. Very low shrinkage and removal rate. Excellent for edge examination.
Aka-Resin Melamine		1	480	Melamine with mineral and glass filler, good edge retention for soft to medium hard materials. Very low shrinkage and high removal rate. Excellent all-round resin. Particularly good where contrast is required e.g. microhardness testing.
Aka-Resin PP, Black		3	620	Polypropylene with mineral filler, excellent all-round resin, medium shrinkage and high removal rate. Dust-free.
Aka-Resin PP, Green		3	620	Polypropylene with mineral filler, excellent all-round resin, medium shrinkage and high removal rate. Dust-free. Perfect when contrast is required and/or colour-coding.
Aka-Resin PP, Orange		3	620	Polypropylene with mineral filler, excellent all-round resin, medium shrinkage and high removal rate. Dust-free. Perfect when contrast is required and/or colour-coding.
Aka-Resin PP, Red		3	620	Polypropylene with mineral filler, excellent all-round resin, medium shrinkage and high removal rate. Dust-free. Perfect when contrast is required and/or colour-coding.
Aka-Resin Acrylic		3	750	Completely clear acrylic resin, for easy visibility of the sample. Low shrinkage and medium removal rate. Best for backfilling and target preparations.
Aka-Resin Phenolic SEM		1	550	Phenolic with graphite filler. Low shrinkage and high removal rate. Conductive, for use in Scanning Electron Microscope (SEM).
Aka-Resin Phenolic		4	600	Phenolic with wood filler. Medium shrinkage and removal rate. Low price, for routine mounting and backfilling.
Aka-Resin Phenolic-2, Black		4	600	Phenolic with wood filler. Medium shrinkage and removal rate. Longer curing time. Lowest price, for routine mounting and backfilling.

\* Shrinkage/edge retention rating (1-5): 1 having the lowest shrinkage and the best edge retention.

\*\* Calculations for the number of samples with 7.5 kg resin is based on a 30 mm diameter mounted specimen of height 15 mm with 20% volume occupied by a specimen. Optimal mounting diameter/height ratio is 2:1.

## Accessories for Mounting

Here you find a range of accessories for cold and hot mounting.

**Moulds** for all types of cold mounting resins. With built-in bevel to avoid ripping cloths or grinding paper while preparing samples. The moulds are available in sizes from 25 – 50 mm dia.

**Silicone lids** to be used with Aka-Mould instead of the normal, hard lid. The soft silicone lid is easier to remove and facilitates assembly and usage of the Aka-Mould. The silicone lid can be used with both acrylic and epoxy resins. A shorter lifetime must be expected with epoxy resins.

**Mounting clips** in stainless steel and in plastic for easy placement of samples while curing. The stainless steel springs are used for holding individual samples, and the plastic clips can hold up to three samples.

To minimise contact between the softer plastic clips and the sample during sample preparation, the clips are elevated on thin legs. This reduces the risk of contamination and edge rounding.

**Protection Caps** can be used to cover the samples after preparation. This will avoid scratching or other damage to the sample surface.

**Mould release products** Aka-NoStick for both cold and hot mounting. For cold mounting the silicone-free Aka-NoStick Liquid is used to coat the inside of the moulds, and for hot mounting, Aka-NoStick Powder is applied on the upper and lower ram of the mounting press to prevent the resin from sticking.

The **Cold Mounting Mixing Kit** consists of 200 paper cups and wooden mixing sticks for easy and fast mixing of both acrylic and epoxy resins.

## Grinding

Grinding is the first real preparation step. Cutting and mounting are not always necessary, but for a successful metallographic sample preparation, a correct sequence of grinding and polishing steps is required.

The process normally starts with plane grinding to remove deformation from sectioning and to obtain a uniform surface across all samples in a holder. Depending on the sample size, hardness and deformation depth, the selection of abrasive defines both the removal rate and the resulting surface finish.

Each step should be evaluated in relation to the next. Excessive deformation or an uneven surface after the first step increases the total preparation time. With the correct choice of consumables, grinding can be carried out efficiently, reducing both preparation time and overall cost while maintaining consistent quality.

## Plane Grinding

For materials with a hardness higher than 150 HV, the best possible choice is the Aka-Piatto. Aka-Piatto is a multi-layer diamond grinding disc that can replace at least 100 - 200 pieces of regular grinding paper. It has a consistently high removal rate and will provide absolutely plane samples with perfect edge retention.

For plane grinding of soft materials with hardness below 150 HV or very ductile materials with a higher hardness grinding paper can still be the correct choice, but harder materials will greatly benefit from the Aka-Piatto. For grinding brittle and fragile materials Aka-Piatto+ is recommended. It has a higher diamond concentration than Aka-Piatto. This results in a lower specific pressure during grinding and thereby less aggressive abrasion. This might result in longer grinding time than with Aka-Piatto. Depending on the size and the hardness of the samples, Aka-Piatto/Aka-Piatto+ in grit sizes P80 – P220 is used for plane grinding.

Usually a single plane grinding step is sufficient when grinding with Aka-Piatto. The absolutely plane samples make it possible to speed up the following fine grinding step.

The table below shows the correct application areas for the different grinding consumables.

	Aka-Piatto	Aka-Piatto+	Rhaco Grit Grinding Paper
<b>Plane Grinding</b>	P80, P120, P220	P80, P120, P220	P80, P120, P180, P220, P320
<b>Use with</b>	Water	Water	Water
<b>Hardness range</b>	> 150 HV	> 150 HV	< 400 HV
<b>Applications / Benefits</b>	Long lifetime, continuous removal and perfect planeness. Can replace several grinding paper steps.	Very long lifetime, continuous removal, perfect planeness, finer surface finish for brittle materials like ceramics and cermets. Can replace several grinding paper steps.	Due to the use of $\text{Al}_2\text{O}_3$ , Rhaco Grit has 2 - 3 times longer lifetime and higher removal compared to standard SiC Paper @ P120 - 320.
<b>For use on magnetic support discs</b>	✓	✓	✓ when used on Aka-Rhaco

## Fine Grinding

After plane grinding, traditionally several fine grinding steps in successively finer grit sizes have been used to make the samples ready for polishing. Also here, new technology has made it possible to speed up preparation and reduce fine grinding to one single step.

Aka-Allegran and Aka-Largan apply a unique system for material removal. Integrated abrasive is released during preparation while abrasive in the form of diamond suspension or diamond spray is applied. The result is high removal, perfect planeness and an exceptional long lifetime.

Aka-Largan and Aka-Allegran replace a number of grinding steps, typically P320 - P1200 with one single fine grinding step. With a constant removal rate these discs are ideal for automatic preparation systems that rely on constant, reproducible settings on every step.

Alternatively, Aka-Piatto can be used in the more traditional way where several grinding steps are carried out successively. As Aka-Piatto is used with water only, cleaning is easier than with Aka-Allegran or Aka-Largan, and not even necessary in-between preparation steps.

For very soft and/or ductile materials it can still be necessary to use traditional grinding paper.

	Aka-Piatto	Aka-Piatto+	Rhaco Grit Grinding Paper
<b>Fine Grinding</b>	P600, P1200, P2400, P4000	P600, P1200	P500, P800, P1000, P1200, P2400, P4000
<b>Use with</b>	Water	Water	Water
<b>Hardness range</b>	> 150 HV	> 150 HV	< 400 HV
<b>Applications / Benefits</b>	Long lifetime, continuous removal and perfect planeness. Can replace several grinding paper steps.	Very long lifetime, continuous removal, perfect planeness, finer surface finish for brittle materials like ceramics and cermets. Can replace several grinding paper steps.	Due to the use of $\text{Al}_2\text{O}_3$ , Rhaco Grit has longer lifetime and higher removal compared to standard SiC Paper @ P500 - 800. For P1000 - 4000 the use of SiC ensures minimum deformation.

## Aka-Piatto

Unique to Aka-Piatto is the colour-coded binder and a wear compensating surface design increasing the planeness of the samples and the lifetime of the Aka-Piatto discs.

3 small tabs make it easy to exchange the Aka-Piatto discs.

Depending on the sample size and machine set-up at least 100 - 200 pieces of grinding paper can be substituted by one Aka-Piatto disc.

The Aka-Piatto discs have been dressed and are ready to use. Depending on the material being prepared, they have to be dressed once in a while during use to ensure continuously high removal.

We recommend using the dressing stick 75310201 to be found in the Accessories section.

## Aka-Piatto+

Aka-Piatto+ is a series of discs with an even higher diamond concentration than Aka-Piatto.

The effect of Aka-Piatto+ is an improved lifetime and finer surface finish on brittle samples like ceramics and cermets due to the lower specific pressure.

Used on metals it results in a finer finish and up to 100% longer lifetime compared to regular Aka-Piatto discs.

Aka-Piatto+ shares all the same features as Aka-Piatto, like colour-coding, the wear compensating design and the 3 small tabs for easy exchange.

The Aka-Piatto+ discs have been dressed and are ready to use. Depending on the material being prepared, they have to be dressed once in a while during use to ensure continuously high removal.

We recommend using the dressing stick 75310201 to be found in the Accessories section.

## Aka-Allegran/Largan

Aka-Allegran and Aka-Largan are rigid fine grinding/polishing discs. They provide a unique system for high material removal, perfect planeness and edge retention and a very long lifetime.

Upon delivery the discs are ready to use and need practically no maintenance.

Aka-Largan 9 is used for fine grinding of soft materials with a hardness from 50 HV up to 400 HV. It is ideal for fine grinding of non-ferrous metals. Diamond suspension or spray in grain sizes from 15 to 3 µm is added during the preparation.

Aka-Largan 9 replaces a number of grinding steps, typically P320 - P1200 with one single step.

Aka-Allegran is available in three different versions for the preparation of materials with a hardness higher than 150 HV.

Aka-Allegran 9, the hardest disc in the range, is used with 15 to 3 µm diamond suspension or spray for fine grinding of materials with a hardness above 450 HV. It will replace the grinding steps from P320 - P1200 with one single step.

Aka-Allegran 6, the most universal disc for fine grinding of all materials with a hardness of above 150 HV with 9 - 3 µm diamonds. It is the ideal disc for fine grinding of all kinds of steel. It will replace the traditional grinding steps from P320 - P1200 with one single step.

Aka-Allegran 3, a medium hard disc, is used with 9 to 3 µm diamond suspension or spray for fine grinding of materials with a hardness above 150 HV. It will replace the grinding steps from P320 - P1200 with one single step. Used with 6 µm diamonds it will produce perfectly flat samples ready for a final polishing with 1 µm. When used with 3 µm diamonds it is perfect for the preservation of soft inclusions in steel and graphite in cast iron.

## Rhaco Grit

If the preparation method requires grinding paper, our own Rhaco Grit has unique advantages:

- With  $\text{Al}_2\text{O}_3$  as abrasive on P80 - P800, the lifetime is up to 2-3 times longer compared to SiC paper. Especially in the coarser grit sizes.
- Replaces self-adhesive paper when used with Aka-Rhaco.

Grit/grain size conversion table

## Grinding Stones

For automatic or semi-automatic plane grinding machines we have both an  $\text{Al}_2\text{O}_3$  grinding stone for grinding of ferrous metals, and a SiC grinding stone for grinding of non-ferrous metals in our program.

They will fit Struers AbraPlan $\circledR$  and MAPS $\circledR$  and QATM System Automat $\circledR$  and Saphir 375 $\circledR$  (with adapter) plane grinding machines.

The stones have a diameter of 356 mm at a height of 45 mm with an arbour diameter of 38 mm. The hole for the flange is 125 mm in dia. and 30 mm deep.

For the QATM Qgrind XL $\circledR$ , Qpol 300 BOT $\circledR$ , System Automat $\circledR$  and Saphir 375 $\circledR$  we also offer both an  $\text{Al}_2\text{O}_3$  and a SiC grinding stone with base plate that can be mounted directly on the machine without the use of an adapter disc.

The stones have a diameter of 350 mm at a height of 50 mm. The centerhole is 125 mm dia. and 40 mm deep.

## Polishing

Polishing has to remove the last deformation introduced during grinding, and to provide a highly reflective finish so the samples can be examined under the microscope.

Soft cloths usually provide the best surface finish but tend to round the edges of the sample and create relief between phases of different hardness.

Hard cloths are good for planeness and edge retention, but tend to leave slight scratches on the surface.

Therefore, a compromise has to be found to create the best possible surface finish with the best planeness and least edge rounding, in the shortest possible time.

Our variety of polishing cloths provides a solution to every polishing challenge, when used with the correct abrasives. The cloths are available in two different versions; magnetic and self-adhesive.

Many laboratories are using a magnetic support disc for an easy exchange of grinding and polishing discs. In this case the polishing cloths on a steel base are the obvious choice. However, the self-adhesive cloths can also be used on magnetic support discs when they are applied on the Aka-Rhaco support disc. This will save money and reduce metallic waste.

## Polishing Cloths

The polishing cloths contain a thick polymer barrier that keeps both abrasive and lubricant at the surface of the cloth to perform the most efficient polishing action.

Plaran and Paran-S are relatively hard cloths used for fine grinding or pre-polishing with 15 µm, 9 µm, 6 µm, 3 µm or 1 µm diamonds.

Silk, Daran, Ramda, Moran-U, Moran and Plural are gradually softer cloths for polishing with 9 - 0.25 µm diamonds.

Napal is used for final polishing with diamond abrasives of 1 µm and finer or for final oxide polishing.

Chemal is used for oxide polishing and especially suited for chemical-mechanical polishing.

The self-adhesive polishing cloths are equipped with an adhesive with low tack and a unique tab that assures easy placing and removal of the cloths. Unique is also the batch code printed directly onto the back of the cloths.

Without removing the liner from the back of the cloths, they can be used directly on Aka-Rhaco and thus on magnetic support discs. See section Magnetic Adaptation.

All magnetic polishing cloths are based on the cloths above, laminated on a steel disc. These steel discs are equipped with 3 tabs for easy removal from the magnetic support disc and lasercut to avoid injuries.

	Cloth material	Fine Grinding	Polishing	Final Polishing	Application
<b>Plaran</b>	Woven Nylon	15 - 6 µm	3 µm	÷	Fine grinding of soft metals, polishing of hard materials
<b>Paran-S</b>	Non-woven Polyester	15 - 3 µm	6 - 1 µm	÷	Fine grinding of soft metals, polishing of hard materials
<b>Daran</b>	Woven Acetate	÷	6 - 1 µm	1 - 0.25 µm Oxide polishing	Polishing of all materials
<b>Ramda</b>	Woven Acetate	÷	3 - 1 µm	1 µm	Polishing of all materials
<b>Silk</b>	100% Woven Silk	9 µm	6 - 1 µm	1 - 0.25 µm Oxide polishing	Fine grinding of ferrous metals, polishing and final polishing of harder materials and coatings
<b>Moran</b>	100% Woven Wool	÷	6 - 3 µm	÷	Polishing of non-ferrous and ferrous metals
<b>Moran-U</b>	100% Woven Wool		6 - 3 µm	1 µm	Polishing and final polishing of non-ferrous and ferrous metals
<b>Plural</b>	Flocked Viscose	÷	3 - 1 µm	÷	Fast, one-step polishing of steels, sintered carbides and other hard materials. Polishing of unmounted samples
<b>Napal</b>	Flocked Viscose	÷	÷	1 - 0.25 µm Oxide polishing	Final polishing of all materials
<b>Chemal</b>	Synthetic Foam	÷	÷	Oxide polishing	Chemical/mechanical final polishing of all materials

## Diamond Products

### *The evolution of diamond products:*

Diamond paste was the first diamond product to be used instead of alumina for polishing of metallographic samples. A small amount of diamond paste is distributed manually on the polishing cloth before preparation. During the preparation process only lubricant is added to achieve the correct lubrication and cooling action. Diamond paste cannot be added during the preparation process, it cannot be dosed automatically and it cannot be used on rigid grinding discs.

To improve on that, diamond spray was introduced. It can be applied during the preparation process, but automatic dosing demanded ingenious constructions and never became common.

When diamond suspension was developed, precise automatic dosing was made possible by using peristaltic pumps and reproducible preparation methods with well-defined dosing levels were a reality. However, as from the beginning, diamond and lubricant were still applied individually.

The next logical step was to combine suspension and lubricant into one liquid, the 2-in-1 diamond suspension. These 2-in-1 suspensions guarantee the correct suspension/lubricant ratio at all times and combine the best possible preparation results with utmost ease of use.

In between the development of the different suspensions the diamond stick was introduced as a substitute of the diamond paste. The diamond stick is easier to use than diamond paste, and is, because of the very high diamond concentration, recommended for priming new, unused polishing cloth. It can, contrary to diamond paste, also be added during preparation.

To cater for all the different requests and to satisfy our customers' wishes, we have developed the widest selection of high quality diamond products.

Most of our diamond products are available in two different versions; with either polycrystalline or monocrystalline diamonds.

The first diamonds to be used for metallographic polishing were natural, monocrystalline diamonds, as used in the production of jewellery. Since then the demand for diamonds for polishing applications has increased dramatically and diamonds are now produced artificially.

Artificial monocrystalline diamonds have replaced natural diamonds in most metallographic applications because they have the same properties. For the highest requirements and the best preparation results, polycrystalline diamonds are traditionally used.

Polycrystalline diamonds break down over time, continuously producing small abrasive edges that provide high material removal while producing only shallow scratches. Monocrystalline diamonds will get more and more round over time, losing their cutting ability.

However, today a new type of monocrystalline diamonds has been developed. These can be described as multicrystalline diamonds. To some extent they have the same ability to break as polycrystalline diamonds, which provides a high removal rate and better performance than traditional monocrystalline diamonds.

## 2-in-1 Diamond Suspensions

### DiaUltra

DiaUltra is a permanently stable, ready mix of suspension and lubricant.

Based on the newest development in diamond suspensions, DiaUltra has the highest removal rates of any currently available 2-in-1 suspension on the market. With DiaUltra it is possible to reduce the preparation time with up to 40%. At the same time, the surface finish is extremely smooth allowing for further reduction of the following step.

The unique formulation allows to use DiaUltra on all fine grinding discs and polishing cloths with equally good results.

DiaUltra is available with monocrystalline (multicrystalline) diamonds as DiaUltra and with polycrystalline diamonds as DiaUltra Poly.

## DiaMaxx

DiaMaxx is a ready mix of lubricant and suspension, it is permanently stable and thus ensures reproducible results.

Based on our high concentration Aka+ suspensions and our high removal Aka-Lube Clear+ we have formulated a product that combines quick preparation with ease of use. DiaMaxx does not contain any oil and is therefore very easy to clean.

DiaMaxx meets the highest requirements in metallographic sample preparation and is available with polycrystalline diamonds as DiaMaxx Poly and with monocrystalline diamonds as DiaMaxx Mono.

## DiaDouble

DiaDouble is a ready mix of lubricant and suspension, it is permanently stable and thus ensures reproducible results.

Based on our Aka suspensions and the Aka-Lube Yellow we have formulated a product that is very well suited for the preparation of softer materials. DiaDouble combines fast preparation with ease of use.

DiaDouble is available with polycrystalline diamonds as DiaDouble Poly and with monocrystalline diamonds as DiaDouble Mono.

## Diamond Suspensions

### Aka-Poly and Aka-Mono

Our diamond suspensions have been developed to combine short preparation times with reproducible results.

They have been formulated with environmentally friendly and easily biodegradable components; and they do not carry any hazard warnings.

In a special process we are able to assure agglomerate-free suspensions from 0.25 µm to 15 µm. This assures outstanding finish without large scratches from agglomerated diamond particles.

## Aka-Poly+ and Aka-Mono+

Aka-Mono+ and Aka-Poly+ have twice the diamond concentration compared to Aka-Poly and Aka-Mono. When used in combination with Aka-Lube Clear+ this assures outstanding removal rates, allowing for up to 50 % reduction in preparation time.

When cost is more of an issue than preparation time, you can reduce the dosing levels of Aka-Mono+ and Aka-Poly+ diamond suspension to half of that used normally. This will give you the same amount of diamonds as with regular concentration Aka-Poly and Aka-Mono and thus the same removal rate and polishing time.

The savings in cost of diamond suspension is about 30 % on our already competitively priced suspensions.

## Aka-Poly WF

These suspensions are fully glycol based thus free of oil and any hazardous or flammable components and do therefore not come with any hazard warnings. They contain less than 0.1% water and are perfect for the preparation of water sensitive samples.

Being oil-free, the suspensions are also easy to clean.

Aka-Poly WF is only available with polycrystalline diamonds.

## Diamond Spray

Diamond spray is easy to use, hassle-free and, because of the absence of liquid, leaves a free-cutting layer of diamonds resulting in high removal rates.

Diamond spray is available with polycrystalline diamonds as Aka-Spray Poly and with monocrystalline diamonds as Aka-Spray Mono.

Our diamond spray contains non-flammable CO<sub>2</sub> and less than 0.1 % water; hence it is very well suited for the preparation of water sensitive materials.

## Diamond Stick

Diamond stick is mainly used for manual polishing and recommended for priming of new polishing cloths. Diamond stick is easier to apply than diamond paste; it can even be applied during the process.

Our diamond stick is compatible with water-, glycol- and ethanol-based lubricants. It contains less than 0.1 % water, and is therefore perfect for the preparation of water sensitive materials.

Diamond stick is available with polycrystalline diamonds as Aka-Stick Poly and with monocrystalline diamonds as Aka-Stick Mono.

## Diamond Paste

Diamond paste is mainly used for manual polishing and quick charging of new polishing cloths.

Our diamond paste is homogeneous, easy flowing and compatible with water-, glycol- and ethanol-based lubricants. It contains less than 0.1 % water, and is therefore perfect for the preparation of water sensitive materials.

Diamond paste is available with polycrystalline diamonds as Aka-Paste Poly and with monocrystalline diamonds as Aka-Paste Mono.

## Oxide Polishing Suspensions

For the final polishing step, where the very last deformations have to be removed, sub-micron sized oxide polishing suspensions are used.

For general applications alumina suspension is used, and for the more demanding applications silica suspensions are the best choice.

The silica suspensions perform a chemical-mechanical polishing action. During polishing, the sample surface is slightly attacked. The resulting layer is removed by the sub-micron silica grains, leaving the sample surface absolutely deformation-free.

We offer a selection of silica and alumina suspensions for the final polishing of different materials:

- The super fine grained colloidal silica or the slightly coarser fumed silica suspensions
- Grain sizes from 0.05 µm to 0.2 µm (50 to 200 nm)
- Unique system to prevent crystal formation
- Our unique water-free suspension of 0.2 µm fumed silica
- The neutral alumina suspension

Product no.	Product name	Contents	GRWT kg
-------------	--------------	----------	---------

**Alkaline silica suspensions, pH 9-10**

48161015	Colloidal Silica Suspension 50 nm Alkaline	1 l	1.49
48161017	Colloidal Silica Suspension 50 nm Alkaline	5 l	6.78
48123015	Fumed Silica Suspension 0.2 µm Alkaline	1 l	1.29
48123017	Fumed Silica Suspension 0.2 µm Alkaline	5 l	5.82

**Water-free fumed silica suspension, for water sensitive materials**

48133015	Fumed Silica Suspension 0.2 µm WF	1 l	1.20
48133017	Fumed Silica Suspension 0.2 µm WF	5 l	6.25

**Neutral alumina suspension, pH 7**

48211015	Alumina Suspension 50 nm Neutral	1 l	1.34
48211017	Alumina Suspension 50 nm Neutral	5 l	6.14

## Lubricants

All diamond products other than our 2-in-1 suspensions require the addition of a lubricant during preparation. The lubricant serves as lubricating and cooling liquid. It has to meet the correct balance between the highest possible removal rate and the best possible surface finish.

Depending on the material to be prepared, and the fine grinding disc or polishing cloth used, the right lubricant has to be selected.

Our water-based lubricants Aka-Lube Green, Yellow and Red utilise a 2-phase system, with particle sizes in the nano range. This allows for the lubricant to get in between the diamonds and the sample into the area where the actual abrasion is taking place. This maximises the lubrication effect.

Water-based lubricants benefit from a high lubrication effect hence reducing heat generation. Along with low evaporation rates this means very stable and uniform preparation. All our lubricants have low viscosity.

**Aka-Lube Clear+** is a superior water/glycol based lubricant helping to achieve outstanding removal rates. Together with Aka-Poly+ and Aka-Mono+ it will provide the fastest possible preparation results.

**Aka-Lube Clear WF** is the water-free version of Aka-Clear+ and ideal for the preparation of water sensitive materials.

**Aka-Lube Blue** is a traditional water-free ethanol based lubricant for general purposes and for the preparation of water sensitive materials.

**Aka-Lube Blue Concentrate** contains all the active ingredients of Aka-Lube, Blue and is simply mixed with ethanol 96% in a ratio of 1:9. Shipping of the concentrate saves both cost and eliminates the risk of shipping a flammable liquid that easily can be sourced locally.

**Aka-Lube Green** maintains a very thin lubrication film, perfect for high removal in the initial preparation stages, for fine grinding and pre-polishing.

**Aka-Lube Yellow** provides a good combination between lubricating and cooling and is used as a general lubricant.

**Aka-Lube Red** produces a thick lubrication film; ideal for final polishing and scratch-free finishes on soft materials.

Product no.	Product name	Contents	GRWT kg
<b>Aka-Lube Clear+, thinnest lubrication film, highest removal rate</b>			
49201015	Aka-Lube Clear+	1 l	1.20

49605013	Aka-Lube Blue Concentrate	500 ml	0.63
49605017	Aka-Lube Blue Concentrate	5 l	5.34

## Magnetic Adaptation

Today, magnetic support discs are more and more common because they facilitate the exchange of grinding and polishing discs.

Instead of removing the complete aluminium disc from the grinding/polishing machine only the preparation surface is exchanged. For that purpose, modern grinding discs like Aka-Piatto and fine grinding discs like Aka-Allegran or Aka-Largan are produced directly on a thin steel disc.

For the best grinding action a stiff support like a steel disc is necessary.

However, not all preparation methods allow the use of these grinding and fine grinding discs, but still require the use of grinding paper. Several solutions are available to use grinding paper on magnetic support discs, but the most efficient and cost effective solution is the Aka-Rhaco.

**Aka-Rhaco** is a thin steel disc with a soft polymer coating. It will safely hold grinding papers allowing over the edge grinding and substituting expensive PSA or foil backed grinding papers. Aka-Rhaco will last for over 1000 applications and will perform perfectly with our own Rhaco Grit grinding paper. This is equipped with a non-woven paper backing that prevents curling.

Instead of using more expensive magnetic polishing cloths on steel discs, the standard Aka-Cloths can also be placed on Aka-Rhaco without removing the liner. Place the cloth on top of Aka-Rhaco and you have a magnetic cloth. When the cloth is worn, simply pull it off and re-use the Aka-Rhaco.

Aka-Rhaco is available with 3 backings:

Aka-Rhaco	Aka-Rhaco Flex	Aka-Rhaco PSA
Thin steel disc for use on magnetic support discs	Soft polymer disc containing ferrous particles for use on magnetic support discs	Self-adhesive foil to be glued directly on an aluminium support disc

**Aka-Ronan 3D** is a steel disc with a 3D-polymer coating. It is used to adapt self-adhesive polishing cloths or other self-adhesive grinding discs for use on magnetic support discs. Remove the liner and attach the self-adhesive product to the surface of Aka-Ronan 3D.

Due to the unique 3D surface air pockets are avoided and the polymer surface allows for easy removal of the cloths once they are worn out.

Aka-Ronan 3D can be used over and over again.

#### Special features of Aka-Ronan 3D:

**Aka-Magnet** is a polymer-based magnetic foil with PSA backing to convert a standard preparation disc to a magnetic support disc.

As with all polymer-based magnets some maintenance is necessary and eventually the foil will wear. Due to the PSA backing it can then easily be replaced.

Product no.	Product name	Contents	GRWT kg
<b>Aka-Magnet, round, self-adhesive magnetic foil</b>			
75110201	Aka-Magnet, PSA backed magnetic foil 200 mm dia.	1 pc.	0.39

## Accessories

Enhance your daily routine with our essential accessories.

**Dressing Sticks:** For occasional dressing of Aka-Piatto, Aka-Allegran and Aka-Largan grinding discs.

**PET Bottles:** 250 and 500 ml bottles with trigger spray. For refilling when using 2.5 or 5 l containers.

**Trigger Spray:** For 250, 500 and 1000 ml bottles. For easy and reproducible manual dosing of all types of liquids including diamond suspensions and lubricants. Approx. 0.5 ml/dosing.

**Adapter Lid:** To convert diamond suspension bottles to dosing bottles with tube and nozzle.

**Disc Cabinet:** Cabinet for the storage of up to 16 steel preparation discs with a diameter of 200 - 300 mm.
